Abstract— Inverters are used in many applications now-a-days. One among the major applications is Dynamic Voltage Restorer (DVR), this exertion explains the built-in photovoltaic based dynamic voltage restorer (DVR) for alleviation of voltage hang down and engorge mitigation. Photo Voltaic (PV) model, DVR model and local grid model are implemented and the results of simulation are presented. In order to improve the efficiency of the PV system Incremental Conductance (INC) algorithm based Maximum Power Point Tracker (MPPT) is connected. The hybrid multilevel inverter is used for exchange of real and reactive power to the sensitive load from PV system. Modeling of the proposed system was developed by MATLAB Simulink. The objective of the proposed system is to study the system behavior, which allows the renewable energy sources for mitigating voltage disturbances. This paper attempts to study and analyze the performance of a DVR based on a new 63-level hybrid multilevel inverter, using minimum required numbers of switches with fuzzy logic controller to compensate balance voltage

Index Terms— Dynamic Voltage Restorer, Maximum Power Point Tracker, Hybrid multilevel inverter, Phase Opposition Disposition (PODPWM)

I. INTRODUCTION

Power quality is of great importance in all modern environments where electricity is involved, power quality can be essentially influenced by an important factor like quality service. One of the major concerns in electricity industry today is power quality problems. Presently, most of the power quality problems are due to different fault conditions. These conditions cause voltage sag, voltage swell, transients, voltage interruption and harmonics. These problems may cause the apparatus tripping, shutdown commercial, domestic and industrial equipment, and miss process of drive system. Dynamic voltage restorer (DVR) can provide the lucrative solution to mitigate voltage sag by establishing the appropriate voltage quality level, necessary. It is recently being used as the active solution for mitigation of power quality problems.

II. PROPOSED POWER SYSTEM MODELING

The proposed power system model comprises PV system, DVR, energy storage devices and hybrid multilevel inverter, Phase Opposition Disposition

A. DYNAMIC VOLTAGE RESTORER

The Dynamic Voltage Restorer (DVR) is fast, flexible and efficient solution to voltage sag problem [2]. It is a powerful electronic based device that provides three phase controllable voltage source, whose voltage vector (magnitude and angle) adds to the source voltage during sag event, to restore the load voltage to pre-sag conditions. It is designed for protecting the whole plant with loads in the range of some MVA. It can restore the load voltage within few milliseconds.

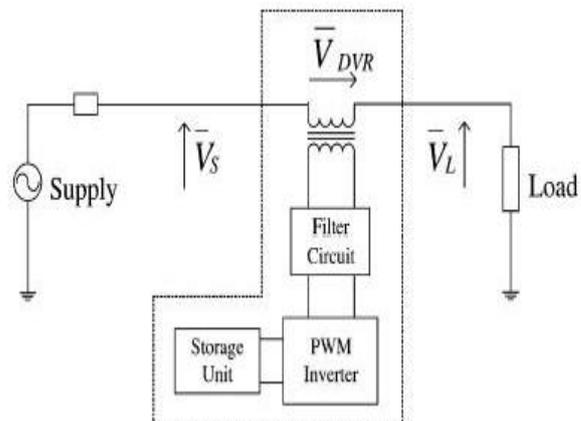

Fig.1 Schematic diagram of DVR

The Fig.1 represents the schematic diagram of DVR.

It contains the basic configuration and components as follows:

III. DVR BASIC CONFIGURATION AND COMPONENTS

During voltage sags, the DVR injects a voltage to restore the load supply voltages. The DVR needs a source of this energy. Two types of system are considered, one using stored energy to supply the delivered power and the other having no internal energy storage, where energy is taken from the incoming supply through a shunt converter.

A. INVERTER CIRCUIT

The Voltage Source Inverter (VSI) or simply the inverter, converts the DC voltage of the energy storage unit (or the DC link) to a controllable three phase AC voltage. The inverter switches are normally fired using a sinusoidal Pulse Width Modulation (PWM) scheme. Since the vast majority of voltage sags seen on utility systems are unbalanced, the VSI will often operate with unbalanced switching functions for the three phases, and must therefore treat each phase independently. Moreover, a sag on one phase may result in a swell on another phase, so the VSI must be capable of handling both sags and swells simultaneously. Another topology of the DVR is the use of the multi-inverter system in the cascade. This method gets rid of the injection transformer used in the basic configuration of the DVR. This arrangement is often called a transformer-less or multilevel or a cascade inverter DVR.

B. FILTERING UNIT

The nonlinear characteristics of semiconductor devices cause distorted waveforms associated with high frequency harmonics at the inverter output. To overcome this problem and provide high quality energy supply, a harmonic filtering unit is used. These filters can be placed either in the inverter side or in the line side.

C. SERIES INJECTION TRANSFORMER

Three single-phase injection transformers are used to inject the missing voltage to the system at the load bars. To integrate the injection transformer correctly into the DVR, the MVA rating, the primary winding voltage and current ratings, the turn-ratio and the short-circuit impedance values of transformers are required. The existence of the transformers allow for the design of the DVR in a lower voltage level, depending upon the stepping up ratio.

D. PHOTOVOLTAIC CELL

Photovoltaic cell generates electricity from the sun. PV panel works under the phenomenon of photoelectric effect. It directly converts sunlight into electricity. The diagram of PV based system.

E. Energy Storage Devices

Energy storage unit is dependable for energy storage in DC

form, Super-Capacitors, Superconducting Magnetic Energy Storage (SMES), lead acid batteries and Flywheels are generally used as energy storage devices. In proposed model energy generated from PV is stored in SMES and supply to DVR at the time of unavailability of solar irradiation.

IV. FUZZY LOGIC CONTROLLERS

In fuzzy logic, basic control is determined by a set of linguistic rules which are determined by the system. Since numerical variables are converted into linguistic variables, mathematical modeling of the system is not required. The fuzzy logic control fig.5 is being proposed for controlling the inverter action on DVR. The fuzzy logic controller has two real time inputs measured at every sample time, named error (e) and error rate (de) and one output named actuating signal for each phase. The input signals are fuzzified and represented in fuzzy set notations as membership functions. The defined „IF-THEN“ rules produce output (actuating) signal and these signals are defuzzified to analog control signals for comparing with a carrier signal to control PWM inverter

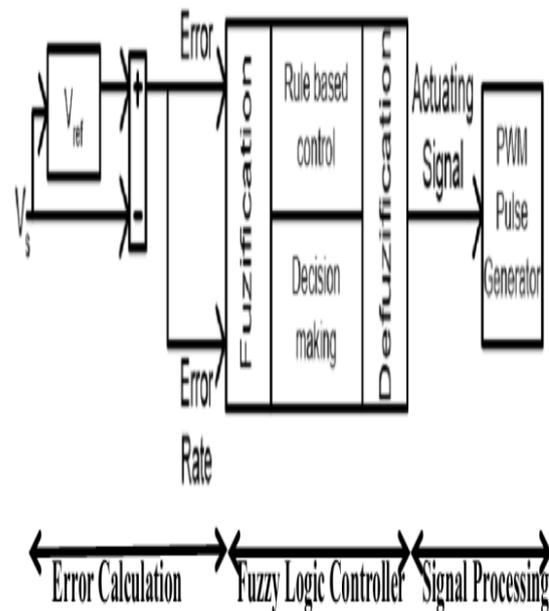

Fig.4.1 Fuzzy Controller.

A. Comparison of THD for DVR and DVR with Fuzzy Control

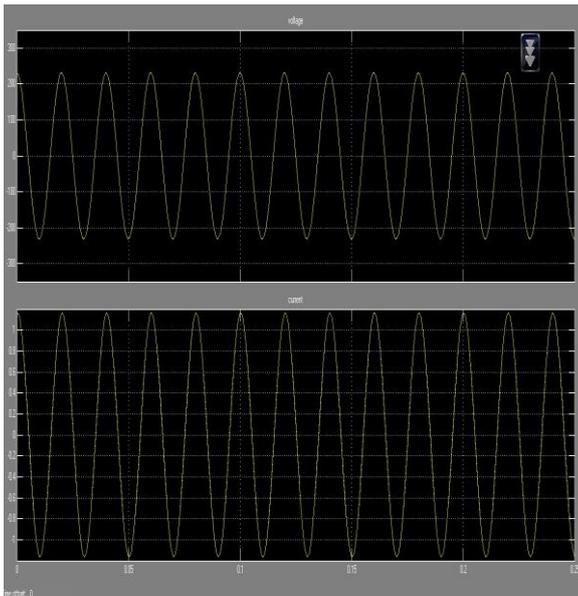

Table.3 shows the comparison of THD values for open loop DVR and DVR with fuzzy control at each phase of load voltage.

B. SIMULATION RESULTS AND DISCUSSIONS

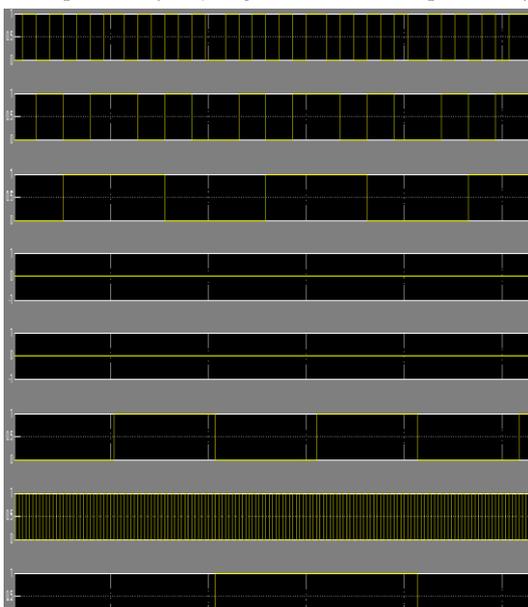

Simulation results are given from fig.6 to fig.9. Now, the disturbances in voltage are compared with the desired voltage. Based on this comparison, error signal to the SMC. This in turn reduces the error signal to as small as a value possible. Depending upon this error signal, the modulating signal is varied which in turn changes the PWM signals obtained. Accordingly, the desired MOSFETS are gated and the necessary voltage is obtained at the inverter output. Fig 6 shows that load voltage before interfaced with DVR. Fig7

VI. CONCLUSION

The simulation of the module layout was successfully carried out using MATLAB Simulink software and the obtained waveforms were observed. In this project a high efficiency grid-tied photovoltaic system using a hybrid multilevel inverter is proposed. Modular configuration is proposed in this project. Due to its modular structure, malfunctioning of any module section will not affect the entire system. POD modulation technique is proposed. The proposed Hybrid MLI can achieved high efficiency and low harmonics and it can reduce the voltage stress on the power switches and also reduces the no of switches. In addition to reducing voltage dip and engorge, DVR can also ensure of ephemeral in voltage, line voltage harmonics mitigation and fault current margins.

The output response of the Photovoltaic (PV) system is analyzed. It is observed that the total harmonic distortion without interfacing inverter is 20.25% and with interfacing inverter is 12.51%. This system would show its feasibility in practice.
